

PREPARE FOR WINTER: KEEP YOUR HOUSE DRY

Reduce excess moisture

- Avoid drying clothes inside, if possible.
- Put lids on pots and pans when cooking.
- Use **extraction fans** in the kitchen and bathroom.
- Wipe condensation off your windows **every day**.

Open your windows and doors

- Try to ensure some air flow through the house, even in winter.
- Open windows after a shower to allow warm, moist air to escape outside.
- Leave a window open at night if it is safe and suitable.

Reduce humidity and moisture levels.

- Extract the moisture **to the outside**, and not into the ceiling, using extractor fans and rangehoods.
- Use a shower cover and curtain to retain humidity in the shower cubicle.
- **Heat your house to at least 18°C.**
- Install a groundsheet (polyethylene barrier or vapour barrier) under your house to effectively reduce indoor humidity. This is very cost effective and most of the time, you can do it yourself.
- If your house is on piles, **ensure good ventilation** of the area under your floor.

Burn dry wood

- Check your firewood moisture content. A wood moisture meter can help see how wet your wood is. **Well-seasoned (dry) wood burns cleaner, and can keep us warmer**, something that we need in a region that gets very still and frosty in winter, and where woodsmoke hangs around and can affect our air quality.
